# Add Switch Logic to the Workflow

Note: Please complete the My First Node-RED application: Basics before using this card.

1 In the Node-RED Flow Editor, scroll through the left palette and find the function section, drag an instance of the switch node to the canvas.

2 Double click on the switch node. Add the rules. For example, if you only want to parse tweets for a specific keyword, and selectively write only these tweets to the database, add a contains rule

3 Use your mouse to insert the switch node between an input and output node(s). For example, send 1 to cloudant and send 2 to debug.

4 Click the Deploy button

5 Check your output nodes (database, debug, etc) to make sure the logic is working.

6 Experiment with other functions. Add a change node to change the content of the payload, add more sophisticated logic with a Javascript function block, or add delays and triggers.
